Problem Statement

The Triangle loyalty program operates in a fragmented state that limits its ability to drive meaningful, measurable Omni channel growth:

On the Marketer Side

Offers are designed manually using spreadsheets and ad-hoc rules. Promotions are broad-based rather than tied to specific customer segments, life stages, or behavioral signals. It is difficult to know which members should receive which offer, on which channel, or what outcome to expect — making rapid experimentation nearly impossible. Measurement of long-term impact remains opaque.

On the Customer Side

Triangle members experience a reactive program that only acknowledges them after a purchase. Offers are not shaped by real-world context — location, time of day, recent activity, seasonal behavior, or upcoming needs. High-intent micro-moments (a commute, a morning coffee run, a seasonal purchase decision) pass without any intelligent nudge. The partner ecosystem — Canadian Tire, Tim Hortons, Sport Chek, and others — operates in silos, preventing any seamless cross-brand journey.

The net result: Triangle has the data and the partner breadth to be an industry-leading proactive engagement platform, but it functions today as a basic points ledger.

Business Proposition: TriStar

TriStar is an AI-powered, two-layer platform that closes the loop between intelligent offer design and real-time offer delivery for Triangle members.

Layer 1 — The Marketer Copilot (Design Intelligence)

Marketers interact with a prompt-driven UI to describe a business objective. The copilot ingests mock Triangle member profiles and historical offer performance data and responds with:

- Recommended segment definitions (e.g., “lapsed high-value outdoor enthusiasts”)
- Offer constructs — points multipliers, threshold offers, cross-category bundles
- Suggested primary channels — email, app, in-store, push
- Estimated impact ranges — expected uplift in visit rate, basket size, or cross-category penetration
- Risk flags — over-discounting, offer cannibalization, frequency caps

The output is an exportable offer brief including segment definition, channels, creative requirements, and KPIs.

Layer 2 — The Real-Time Activation Engine (Delivery Intelligence)

Once an offer is designed and approved, the activation engine takes over. It monitors contextual signals and determines the optimal moment to deliver the offer to each targeted member:

- Location proximity to partner stores
- Time of day, day of week, and seasonal patterns
- Weather conditions and environmental triggers
- Recent purchase behavior and browsing activity
- Partner ecosystem cross-brand opportunity windows

A member near a Tim Hortons on a cold morning who hasn’t visited Canadian Tire in two weeks might receive a push notification bridging both brands. A member opening the app midweek gets a contextually timed cross-category nudge relevant to their last purchase pattern.

Together: the right offer reaches the right person at the right moment — designed with intelligence, delivered with precision.
